## Fourier Optics Terminology

## Fourier Optics Terminology

## Fourier Optics Equations (1)

- Fresnel-Kirchoff Integral

$$
\begin{aligned}
& E\left(x_{1}, y_{1}, z_{1}\right)=\frac{j k e^{j k z_{1}}}{2 \pi z_{1}} e^{j k \frac{\left(x_{1}^{2}+y_{1}^{2}\right)}{2 z_{1}}} \times \\
& \qquad \iint E(x, y, 0) e^{j k \frac{\left(x^{2}+y^{2}\right)}{2 z_{1}}} e^{-j k \frac{\left(x x_{1}+y y_{1}\right)}{z_{1}}} d x d y
\end{aligned}
$$

- In Spatial Frequency with Source Curvature Removed

$$
E\left(f_{x}, f_{y}, z_{1}\right)=\frac{j 2 \pi z_{1} e^{j k z_{1}}}{k} e^{j k \frac{\left(x_{1}^{2}+y_{1}^{2}\right)}{z_{1}}} \iint E(x, y, 0) e^{-j 2 \pi\left(f_{x} x+f_{y} y\right)} d x d y
$$

- Both Curvatures Removed

$$
E\left(f_{x}, f_{y}, z_{1}\right)=\frac{j 2 \pi z_{1} e^{j k z_{1}}}{k} \iint E(x, y, 0) e^{-j 2 \pi\left(f_{x} x+f_{y} y\right)} d x d y
$$

## Fourier Optics Equations (2)

- Define Frequency-Domain Field

$$
\tilde{E}\left(f_{x}, f_{y}\right)=j z_{1} \lambda e^{j k z_{1}} E\left(f_{x}, f_{y}, z_{1}\right),
$$

- Fourier Transform

$$
\tilde{E}\left(f_{x}, f_{y}\right)=\iint E(x, y, 0) e^{-j 2 \pi\left(f_{x} x+f_{y} y\right)} d x d y
$$

- Inverse Fourier Transform

$$
E(x, y)=\iint \tilde{E}\left(f_{x}, f_{y}\right) e^{-j 2 \pi\left(f_{x} x+f_{y} y\right)} d f_{x} d f_{y}
$$

## Three Configurations for Fourier Optics

See Chapter 8 for Fresnel-Kirchoff Integral Equation Use One of These Configurations to Remove Curvature

$$
\begin{gathered}
E\left(x_{1}, y_{1}, z_{1}\right)=\frac{j k e^{j k z_{1}}}{2 \pi z_{1}} e^{j k \frac{\left(x_{1}^{2}+y_{1}^{2}\right)}{2 z_{1}}} \times \\
\iint E(x, y, 0) e^{j k \frac{\left(x^{2}+\nu^{2}\right)}{2 z_{1}}} e^{-j k \frac{\left(\frac{\left(x_{1}+w_{1}\right)}{z_{1}}\right.}{z_{1}}} d x d y \\
0 \\
\hline 0
\end{gathered}
$$

## Optical Fourier Transform

Modify Image in Field Plane. Modify FT in Pupil Plane

$$
f_{x}=\frac{k}{2 \pi z} x_{1}=\frac{x_{1}}{\lambda z} \quad f_{y}=\frac{k}{2 \pi z} y_{1}=\frac{y_{1}}{\lambda z}
$$

## Fourier Analysis: FT and IFT

- Pupil to Field $\left(x_{1}, y_{1}\right)$ to $(x, y)$ : Fourier Transform

$$
E\left(x_{1}, y_{1}, z_{1}\right)=\frac{j k e^{j k z_{1}}}{2 \pi z_{1}} \iint E(x, y, 0) e^{-j k \frac{\left(x x_{1}+y y_{1}\right)}{z_{1}}} d x d y
$$

- Field to Pupil: $(x, y)$ to $\left(x_{2}, y_{2}\right)$ : Fourier Transform. .

$$
E\left(x_{2}, y_{2}, z_{2}\right) \stackrel{?}{=} \frac{j k e^{j k z_{2}}}{2 \pi z_{2}} \iint E(x, y, 0) e^{-j k \frac{\left(x x_{2}+y y_{2}\right)}{z_{2}}} d x d y
$$

- . . . or Inverse Fourier Transform?

$$
E\left(x_{2}, y_{2}, z_{2}\right) \stackrel{?}{=} \frac{j k e^{-j k z_{1}}}{2 \pi z_{1}} \iint E(x, y, 0) e^{j k \frac{\left(x x_{2}+y y_{2}\right)}{z_{1}}} d x d y
$$

- Negative Signs and Scaling ( $z_{1}$ vs. $z_{2}$ )

$$
x_{2}=-\frac{f_{2}}{f_{1}} x_{1} \quad y_{2}=-\frac{f_{2}}{f_{1}} y_{1}
$$

## Computation: The Amplitude Transfer Function

- Field Plane: Convolve with Point-Spread Function
- Pupil Plane: Multiply by Amplitude Transfer Function

## Computation: Steps

1. Multiply the object by a binary mask to account for the entrance window, and by any other functions needed to account for non-uniform illumination, transmission effects in field planes, etc.,
2. Fourier transform.
3. Multiply by the ATF, which normally includes a binary mask to account for the pupil, and any other functions that multiply the field amplitude in the pupil planes.
4. Inverse Fourier transform.
5. Scale by the magnification of the system.

## Isoplanatic Systems

- Analogy to Temporal Signal Processing
- Linear Time-Shift-Invariant Systems
- Convolution with Impulse Response in Time Domain
- Multiplication with Transfer Function in Frequency Domain
- Fourier Optics Assumption
* Linear Space-Shift-Invariant Systems
* Convolution with Point-Spread Function in Image
* Multiplication with 2-D Transfer Functions in Pupil

## Non-Isoplanatic Systems

- Some Aberrations Depend on Field Location
- Coma
- Astigmatism and Field Curvature
- Distortion
- Somewhat Isoplanatic over Small Regions
- Twisted Fiber Bundle
- Random Re-location of light from pixels
- Not at All Shift-Invariant

## Anti-Aliasing Filter

- Spatial Frequency in the Pupil Plane

$$
f_{x}=\frac{u}{\lambda}
$$

- Cutoff Frequency

$$
f_{\text {cutoff }}=\frac{N A}{\lambda}
$$

- Example: $\lambda=500 \mathrm{~nm}$ and $N A=0.5$

$$
f_{\text {cutoff }}=1 \mathrm{cycle} / \mu \mathrm{m}
$$

- Nyquist Sampling in the Object Plane

$$
f_{\text {sample }}=2 \mathrm{cycles} / \mu \mathrm{m}
$$

- In Image Plane

$$
m=\frac{4}{2} \times \frac{4.5}{6}=1.5
$$

- Pixel pitch

$$
0.5 \mu \mathrm{~m} \times m=0.75 \mu \mathrm{~m}
$$

- Smaller than Practical
- Need More Magnification

## Anti-Aliasing: Practical Examples

- Microscope, $\lambda=500 \mathrm{~nm}$
- 100X, Oil Immersion $N A=1.4$
- Object Plane

$$
f_{\text {cutoff }}=\frac{N A}{\lambda}=
$$

2.8Cycles/ $\mu \mathrm{m}$

- Image Plane

$$
\begin{aligned}
f_{\text {cutoff }} & =\frac{N A}{\lambda} / m= \\
f_{\text {sample }} & =2 f_{\text {cutoff }}=
\end{aligned}
$$

0.056 pixels/ $\mu \mathrm{m}$

- pixel spacing $\leq 4.5 \mu \mathrm{~m}$
- Camera (Small m)
- Small NA, Large F

$$
\begin{aligned}
& N A_{\text {image }}=n^{\prime} \frac{1}{|m-1| 2 F} \approx \frac{1}{2 F} \\
& f_{\text {sample }}=2 f_{\text {cutoff }}= \\
& 2 \times \frac{N A}{\lambda}=\frac{1}{\lambda F_{\min }}
\end{aligned}
$$

- F-Number

$$
F_{\min }=\frac{1}{\lambda f_{\text {sample }}}=
$$

$$
\frac{x_{\text {pixel }}}{\lambda}=\frac{5 \mu \mathrm{~m}}{500 \mathrm{~nm}}=10
$$

## Fourier Optics, Coherent Light: Amplitude Transfer Function

$$
\mathrm{PSF} \quad h(x, y)=\iint \tilde{h}\left(f_{x}, f_{y}, 0\right) e^{-j 2 \pi\left(f_{x} x+f_{y} y\right)} d f_{x} d f_{y}
$$

$$
E_{\text {image }}(x, y)=E_{\text {object }}(x, y) \otimes h(x, y)
$$

$$
\text { ATF } \quad \tilde{h}\left(f_{x}, f_{y}\right)=\iint h(x, y, 0) e^{j 2 \pi\left(f_{x} x+f_{y} y\right)} d x d y
$$

$$
\tilde{E}_{\text {image }}\left(f_{x}, f_{y}\right)=\tilde{E}_{\text {object }}\left(f_{x}, f_{y}\right) \tilde{h}\left(f_{x}, f_{y}\right)
$$

## Gaussian Apodization Degrades Resolution, Reduces Sidelobes

## Improved (?) Imaging with Gaussian Apodization

A. Knife Edge Object

C. Image with Aperture

B. Image Slices

D. Image with Gaussian

## Coherent Fourier Optics Summary

- Isoplanatic imaging system; pairs of planes such that field in one is scaled Fourier transform of that in the other. Several Configurations.
- It is often useful to place the pupil at one of these planes and the image at another.
- Then the aperture stop acts as a low-pass filter on the Fourier transform of the image. This filter can be used a an anti-aliasing filter for a subsequent sampling process.
- Other issues in an optical system can be addressed in this plane, all combined to produce the transfer function.
- The point-spread function is a scaled version of the inverse Fourier transform of the transfer function.
- The transfer function is the Fourier transform of the point-spread function.
- The image can be viewed as a convolution of the object with the pointspread function.

## Fourier Optics for Incoherent Imaging (1)

- Even an LED Source Usually Results in an Incoherent Image

$$
\delta \lambda=\lambda / 30 \quad \tau_{c} \approx \frac{30}{\nu}=30 \frac{\lambda}{c} \approx 60 \mathrm{fs} \quad\langle h(x, y)\rangle=0 \quad T \gg \tau_{c}
$$

- Incoherent Point-Spread Function

$$
H(x, y)=\left\langle h(x, y) h^{*}(x, y)\right\rangle
$$

$$
I_{\text {image }}(x, y)=\left[h(x, y) \otimes E_{\text {object }}(x, y)\right]\left[h^{*}(x, y) \otimes E_{\text {object }}^{*}(x, y)\right]
$$

- Cross Terms to Zero: Linear Equation

$$
I_{\text {image }}(x, y)=\left[h(x, y) h^{*}(x, y)\right] \otimes\left[E_{\text {object }}(x, y) E_{\text {object }}^{*}(x, y)\right]
$$

## Fourier Optics for Incoherent Imaging (2)

- Incoherent Image as Convolution

$$
I_{\text {image }}(x, y)=H(x, y) \otimes I_{\text {object }}(x, y)
$$

$$
\tilde{H}\left(f_{x}, f_{y}\right)=\tilde{h}\left(f_{x}, f_{y}\right) \otimes \tilde{h}^{*}\left(f_{x}, f_{y}\right)
$$

$$
\tilde{h}^{*}\left(f_{x}, f_{y}\right)=\tilde{h}\left(-f_{x},-f_{y}\right)
$$

- OTF (Incoherent) is autocorrelation of ATF (Coherent)

## Optical Transfer Function

- Optical Transfer Function, OTF (Previous Page)

$$
\tilde{H}\left(f_{x}, f_{y}\right)=\tilde{h}\left(f_{x}, f_{y}\right) \otimes \tilde{h}^{*}\left(f_{x}, f_{y}\right)
$$

- Modulation Transfer Function, MTF

$$
\left|\tilde{H}\left(f_{x}, f_{y}\right)\right|
$$

- Phase Transfer Function, PTF

$$
\angle\left[\tilde{H}\left(f_{x}, f_{y}\right)\right]
$$

## Fourier Optics Example: Square Aperture ATF

"AC" Amplitude Reduced more than "DC:" Contrast Degraded

## Fourier Optics Example: Coherent and Incoherent

## Image Shift (Prism in Pupil)

- Amplitude Transfer Function: Phase Ramp

$$
g \widetilde{h}\left(f_{x}, f_{y}\right)=\exp \left[i 2 \pi \frac{f_{x} / 4}{1128}\right] \quad \begin{gathered}
\text { for } f_{x}^{2}+f_{y}^{2} \leq f_{\text {max }}^{2} \\
\text { Otherwise }
\end{gathered}
$$

Coh. PTF

Physical Configuration

Inc. PTF

## Image through Image Shifter

Coherent Object: $\sin \left(2 \pi f_{x} x\right)$
Incoherent Object: $\left[\sin \left(2 \pi f_{x} x\right)\right]^{2}=\frac{1}{2}-\frac{1}{2} \cos \left(2 \pi \times 2 f_{x} x\right)$

Object Above, Image Below. Note Color Axis Change.

(A) Coherent Image Shifted 1/4 Cycle

x, Position, Pixels
(B) Incoherent Image Shifted 1/2 Cycle

## Incoherent Imaging with Camera

- Pixel Current ( $\rho_{i}$ Represents Pixel Response

$$
i_{m n}=\iint_{\text {pixel }} \rho_{i}(x-m \delta x, y-n \delta y) E(x, y) E^{*}(x, y) d x d y
$$

- Signal as Convolution with Pixel Followed by Sampling

$$
i_{m n}=\left\{\left[E(x, y) E^{*}(x, y)\right] \otimes \rho_{i}\right\} \times \delta\left(x-x_{m}\right) \delta\left(y-y_{n}\right)
$$

- Complete Transfer Function

$$
\begin{gathered}
\tilde{i}=\tilde{I} \tilde{H} \tilde{\rho}_{i} \\
I=\left[E(x, y) E^{*}(x, y)\right]
\end{gathered}
$$

## Summary of Incoherent Imaging

- The incoherent point-spread function is the squared magnitude of the coherent one.
- The optical transfer function (incoherent) is the autocorreIation of the amplitude transfer function (coherent).
- The OTF is the Fourier transform of the IPSF.
- The DC term in the OTF measures transmission.
- The OTF at higher frequencies is usually reduced both by transmission and by the width of the point-spread function, leading to less contrast in the image than the object.
- The MTF is the magnitude of the OTF. It is often normalized to unity at DC. The PTF is the phase of the OTF. It describes a displacement of a sinusoidal pattern.

## Characterizing an Optical System

- Overall light transmission. e.g. OTF at DC, or equivalently the integral under the incoherent PSF.
- The 3-dB (or other) bandwidth or the maximum frequency at which the transmission exceeds half (or other fraction) of that at the peak.
- The maximum frequency is where the MTF drops below some very low value which can be considered zero. (Think Nyquist)
- Height, phase, and location of sidelobes.
- The number and location of zeros in the spectrum. (Missing spatial frequencies)
- The spatial distribution of the answers to any of these questions in the case that the system is not isoplanatic.

## System Metrics

- What is the diffraction-limited system performance, given the available aperture?
- What is the predicted performance of the system as designed? (Include Aberrations)
- What are the tolerances on system parameters to stay within specified performance limits?
- What is the actual performance of a specific one of the systems as built? (Measure)

## Test Objects

- PSF
- LSF: Line Spread Function
- ESF:

Edge
Spread
Function

- MTF and
- PTF
(partial)

A. Point and Lines |||||||

C. X Bar Chart

B. Knife Edge

D. Y Bar Chart

## The Air-Force Resolution Chart

## 

$$
x=\frac{1 \mathrm{~mm}}{2^{G+1+(E-1) / \sigma}}
$$

Radial Bar Chart

## Effect of Pixels

(A) $30 \times 30$

(B) $30 \times 10$

## Summary of System Characterization

- Some systems may be characterized by measuring the PSF directly.
- Often there is insufficient light to do this.
- Alternatives include measurement of LSF or ESF.
- The OTF can be measured directly with a sinusoidal chart.
- Often it is too tedious to use the number of experiments required to characterize a system this way.
- A variety of resolution charts exist to characterize a system. All of them provide limited information.
